

ARMORGALV® EXCELLENT RESULTS

Below please see Tapcon parts that were coated with **ArmorGalv® BLUE**. Please note that the parts on the right were drilled into concrete and removed and still exhibit the blue color after 48 hours of salt spray. The **ArmorGalv®** Base Coat will allow ANY paint to exhibit this phenomenon because it acts like a "sponge" to absorb paint **BELOW** the surface. The next pages shows the drilled parts after 1,300 hours of salt spray.

This explains why the **ArmorGalv®** BLUE can retain paint even after drilling:

Notice that the paint penetrates into the "fissures" of the **ArmorGalv®** surface. This prevents lateral corrosion pathways when the paint is compromised or damaged, thus eliminating paint-peel.
